From Solar Flares to Power Scarcities: What is Space Weather and How Does It Affect Us?

By Victoria Cramb

The Sun's magnetic field has an influence that extends throughout the solar system and is driven by the solar magnetic cycle, which is 22 years. The interaction between the Sun's magnetic field and Earth's magnetic field generates the Earth's magnetic field, which is essential for life as we know it. Space weather events can have significant effects on Earth, including disruptions to power grids, communications, and transportation systems. The Space Weather Action Group (SWAG) founded in 1989, is a network of professionals dedicated to understanding and mitigating the impacts of space weather on society.
